

# BALTRIS Training on Road Safety

## Information and contact

## Enhancing road safety all over Europe

Benefits for road users of today and generations to come

Safety management in road infrastructure must follow the phases of a road's life span; from early planning through construction to regular maintenance of the existing road. BALTRIS Trainings consists of two blocks, focusing all phases of road safety management.

### BALTRIS Training

- Block 1 Road safety audit  
Road safety inspection
- Block 2 Road safety impact assessment  
Network safety management

### Why training?

Working with road safety is often performed at a national level. Thus differences in improving road safety is common. If we work together towards an improved road infrastructure we can make a difference for road users **all over Europe**. Uniting the knowledge of infrastructure management sets an essential fundament for improving road safety crossing regional and national borders. The positive effect will **benefit today's Europeans and generations to come**.

### Who should to trainings?

Participants at the BALTRIS training will receive knowledge and training on principles and tools for planning, performing and communicating. Based on the best experience solutions, the trainings will help **road engineers and constructors** to develop a safer and better road infrastructure.

### How to get training?

When interested in the BALTRIS training, please contact responsible academic institution in your country. If your country is not in the list, please contact the Estonian or the Swedish representative.
